

Panel 3: Intra-Phase Similarity Computation

Step 9: Exploitation Phase [dog, cat]

Similarity Matrix:

	dog	cat
dog	1.00	0.82
cat	0.82	1.00

Upper triangle: 0.82

$\mu_{\text{exploit_intra}} = 0.82$

Step 9: Exploration Phase [cat->lion]

Transition similarity:

cat->lion = 0.38

$\mu_{\text{explore_intra}} = 0.38$

For single transitions:
intra = transition similarity

Step 10: Phase Centroid Calculation

For each phase:
Centroid = mean(all word vectors)

Phase 1 (dog, cat):
 $c_1 = \text{mean}([\text{dog_vec}, \text{cat_vec}])$
= [0.135, -0.435, 0.795, ...]

Phase 2 (lion, tiger):
 $c_2 = \text{mean}([\text{lion_vec}, \text{tiger_vec}])$
= [0.180, -0.380, 0.820, ...]
